# Fraud Investigation Handbook

## 1. Investigator Conduct

Investigators assist in identifying potentially suspicious activity. The determination of whether activity constitutes fraud is made by Compliance and, where applicable, law enforcement — never by the investigating analyst alone or by an automated system.

## 2. Account Takeover Indicators

A customer whose transaction history consists of small, regular payments and who suddenly initiates a large transfer from a new device, new location, or new country should be treated as a possible account takeover. The account should be temporarily flagged for step-up verification before further large transactions are permitted.

## 3. Using AI-Assisted Analysis

AI tools may be used to summarize evidence, explain detected patterns, and draft investigation reports. AI-generated explanations must always be reviewed by the analyst before being relied upon, and must never be presented to a customer or regulator as a final determination of fraud.

## 4. Report Structure

Investigation reports should include: an executive summary, key findings with supporting evidence, and recommended next steps for the analyst. Reports should avoid definitive language such as 'this is fraud' and instead describe findings as warranting further review.
