Transaction Monitoring Procedures

1. Alert Triage

All system-generated alerts must be triaged within one business day. Alerts with a computed risk score of 70 or above are considered high priority and must be reviewed the same day they are generated.

2. Evidence Standards

Every finding recorded against a case must be supported by specific transaction evidence: timestamp, amount, sender account, receiver account, and country. Narrative conclusions without linked evidence are not acceptable for case closure.

3. Geographic Risk Review

A transaction to a country not previously observed in a customer's history should be treated as a moderate risk indicator on its own, and a high risk indicator when combined with an unusual amount or a new beneficiary.

4. Case Documentation

Analysts must record: the alert type, the supporting evidence, the actions taken, and the final disposition (confirmed suspicious activity, false positive, or referred for further review).
Cases must never be closed without a documented rationale.
